COURSE TITLE

SQL Advanced: Supply Chain Analytics

CHAPTER TITLE

Database Triggers

- 1** In real-time, new records are added to data tables on a regular basis based on the business requirements of data engineers.
- 2** A trigger can be created to update table records on multiple tables when a new record is inserted in a particular table.
- 3** Common use cases of triggers are-
 - To create aggregated/derived data
 - Create historical update logs
 - Data Validation
